The Wilson/Fish model yields higher job retention rates for refugees in Tennessee than the traditional model.

During years when Tennessee followed the traditional model (2005-2009), on average, about 20% of refugees retained their jobs after the inital 90 days. After shifting to Wilson/Fish (2010-2018), the average increased to 50% of refugees retaining their jobs after the initial 90 days.
